A 54-year-old woman with a slowly growing periungual tumor mass, pathologically verified as pilomatrixoma, is described. A multi-aspect overview of the clinical, diagnostic, and therapeutic features of this hair matrix-derived benign neoplasm are presented to accentuate the importance of a proper clinico-pathological approach and raise the suspicion index, even on such an anecdotally rare predilection.

Key-words: pilomatrixoma, periungual localization
